

QIP Investigation Report

Closed case record

INVESTIGATION ID: 00000000-0000-0000-0000-000000000301

GENERATED: 2026-08-27 12:00 UTC

Case summary

ASSET: Atlas HP-40 Hydraulic Press (MACHINE)

INCIDENT: Synthetic HP-40 heat and slow retract

SEVERITY / STATUS: HIGH / RESOLVED

OCCURRED: 2026-08-27 10:00 UTC

Hydraulic return pressure exceeded the synthetic threshold during a controlled test cycle.

Observations

2026-08-27 11:00 UTC - synthetic-investigator

Synthetic observation 1: return temperature remained elevated while retract speed decreased.

2026-08-27 11:01 UTC - synthetic-investigator

Synthetic observation 2: return temperature remained elevated while retract speed decreased.

2026-08-27 11:02 UTC - synthetic-investigator

Synthetic observation 3: return temperature remained elevated while retract speed decreased.

2026-08-27 11:03 UTC - synthetic-investigator

Synthetic observation 4: return temperature remained elevated while retract speed decreased.

2026-08-27 11:04 UTC - synthetic-investigator

Synthetic observation 5: return temperature remained elevated while retract speed decreased.

2026-08-27 11:05 UTC - synthetic-investigator

Synthetic observation 6: return temperature remained elevated while retract speed decreased.

2026-08-27 11:06 UTC - synthetic-investigator

Synthetic observation 7: return temperature remained elevated while retract speed decreased.

2026-08-27 11:07 UTC - synthetic-investigator

Synthetic observation 8: return temperature remained elevated while retract speed decreased.

2026-08-27 11:08 UTC - synthetic-investigator

Synthetic observation 9: return temperature remained elevated while retract speed decreased.

2026-08-27 11:09 UTC - synthetic-investigator

Synthetic observation 10: return temperature remained elevated while retract speed decreased.

2026-08-27 11:10 UTC - synthetic-investigator

Synthetic observation 11: return temperature remained elevated while retract speed decreased.

2026-08-27 11:11 UTC - synthetic-investigator

Synthetic observation 12: return temperature remained elevated while retract speed decreased.

2026-08-27 11:12 UTC - synthetic-investigator

Synthetic observation 13: return temperature remained elevated while retract speed decreased.

2026-08-27 11:13 UTC - synthetic-investigator

Synthetic observation 14: return temperature remained elevated while retract speed decreased.

2026-08-27 11:14 UTC - synthetic-investigator

Synthetic observation 15: return temperature remained elevated while retract speed decreased.

2026-08-27 11:15 UTC - synthetic-investigator

Synthetic observation 16: return temperature remained elevated while retract speed decreased.

2026-08-27 11:16 UTC - synthetic-investigator

Synthetic observation 17: return temperature remained elevated while retract speed decreased.

2026-08-27 11:17 UTC - synthetic-investigator

Synthetic observation 18: return temperature remained elevated while retract speed decreased.

2026-08-27 11:18 UTC - synthetic-investigator

Synthetic observation 19: return temperature remained elevated while retract speed decreased.

2026-08-27 11:19 UTC - synthetic-investigator

Synthetic observation 20: return temperature remained elevated while retract speed decreased.

2026-08-27 11:20 UTC - synthetic-investigator

Synthetic observation 21: return temperature remained elevated while retract speed decreased.

2026-08-27 11:21 UTC - synthetic-investigator

Synthetic observation 22: return temperature remained elevated while retract speed decreased.

2026-08-27 11:22 UTC - synthetic-investigator

Synthetic observation 23: return temperature remained elevated while retract speed decreased.

2026-08-27 11:23 UTC - synthetic-investigator

Synthetic observation 24: return temperature remained elevated while retract speed decreased.

Evidence

MEASUREMENT - HUMAN_ENTERED

Return-filter differential measured 3.1 bar during the synthetic test.

Source: Synthetic gauge SG-14 | Submitted by: synthetic-investigator | Event: 2026-08-27 11:01 UTC

Grounded questions

GROUNDED - What should be inspected first?

Evidence supports inspecting the return filter first; other contributing factors remain uncertain.

Source: Atlas HP-40 Synthetic Service Manual, page 2 | Inspect the return filter when differential pressure exceeds 2.5 bar.

Asked: 2026-08-27 11:30 UTC | Prompt: grounded-answer-v3 | Model: deterministic-grounded-v1

Human-reviewed findings

CONFIRMED - Inspect and replace the return filter before restart.

Proposed by synthetic-investigator at 2026-08-27 11:33 UTC

Review rationale: The measurement and cited threshold support this bounded finding.

Reviewed by synthetic-reviewer at 2026-08-27 11:40 UTC

Audit: PROPOSED - synthetic-investigator - 2026-08-27 11:33 UTC

Audit: CONFIRMED - synthetic-reviewer - 2026-08-27 11:40 UTC - The measurement and cited threshold support this bounded finding.

Closure

The confirmed return-filter finding closes this synthetic case. Other factors remain uncertain.
